

# Java - Introduction to Programming

## Lecture 4

### Loops

A loop is used for executing a block of statements repeatedly until a particular condition is satisfied. A loop consists of an initialization statement, a test condition and an increment statement.

#### For Loop

The syntax of the for loop is :

```
for (initialization; condition; update) {  
    // body of-loop  
}
```

```
for (int i=1; i<=20; i++) {  
    System.out.println(i);  
}
```

#### While Loop

The syntax for while loop is :

```
while(condition) {  
    // body of the loop  
}
```

```
int i = 0;  
while(i<=20) {  
    System.out.println(i);  
    i++;  
}
```

#### Do-While Loop

The syntax for the do-while loop is :

```
do {  
    // body of loop;  
}  
while (condition);
```

```
int i = 0;  
do {  
    System.out.println(i);  
}
```

```
i++;  
} while(i<=20);
```

## Homework Problems

1. Print all even numbers till n.
2. Run

```
for(; ;) {  
  
    System.out.println("Apna College");  
  
}
```

loop on your system and analyze what happens. Try to think of the reason for the output produced.

3. Make a menu driven program. The user can enter 2 numbers, either 1 or 0.

If the user enters 1 then keep taking input from the user for a student's marks(out of 100).

If they enter 0 then stop.

If he/ she scores :

**Marks >=90** -> print "This is Good"

**89 >= Marks >= 60** -> print "This is also Good"

**59 >= Marks >= 0** -> print "This is Good as well"

Because marks don't matter but our effort does.

(Hint : use do-while loop but think & understand why)

## BONUS

Qs. Print if a number is prime or not (Input n from the user).

[In this problem you will learn how to check if a number is prime or not]

## Homework Solution (Lecture 3)

```
import java.util.*;  
  
public class Conditions {  
    public static void main(String args[]) {  
        Scanner sc = new Scanner(System.in);  
        int a = sc.nextInt();  
        int b = sc.nextInt();  
        int operator = sc.nextInt();  
  
        /**  
         * 1 -> +  
         * 2 -> -  
         * 3 -> *  
         * 4 -> /  
         * 5 -> %  
         */  
  
        switch(operator) {  
            case 1 : System.out.println(a+b);  
            break;  
            case 2 : System.out.println(a-b);  
            break;  
            case 3 : System.out.println(a*b);  
            break;  
            case 4 : if(b == 0) {  
                System.out.println("Invalid Division");  
            } else {  
                System.out.println(a/b);  
            }  
            break;  
            case 5 : if(b == 0) {  
                System.out.println("Invalid Division");  
            } else {  
                System.out.println(a%b);  
            }  
            break;  
            default : System.out.println("Invalid Operator");  
        }  
    }  
}
```

}
